

CS 1093 Lab One –

Assuming there are no accidents or delays, the distance that a car travels down the interstate can be calculated with the following formula (distance should be a float variable):

Distance is Speed X Time

A car is traveling at 60 miles per hour. Design and Code a program in python that displays the following (display the distance with 2 decimal points):

- The distance the car will travel in 5 hours
- The distance the car will travel in 8 hours
- The distance the car will travel in 12 hours

*** Do not do the calculations on the same line as your print

** Make sure you put the author and date created at top of your program
